Subject: RE: Congressman Xavier Becerra's Staffer Irvin De La O' Follow Up Questions on Our Response on Exide in Vernon, CA

Dan –

Thanks for your message. I will let Irvin De La O know that we will try to respond to his latest questions by the end of this week. I am working flexiplace on Thursday and will be out on CDO on Friday and then on annual leave until next Thursday, December 18th, and then will be out of the office on annual leave until December 29th. I will send a note back to Irvin De La O that we will need a few days to respond to his latest questions and that if I am out of the office, either Dean or Kelly will be sending him responses. I want to make sure that everyone is satisfied with our responses including ORC to the questions he raised before we send.

Because of my being out of the office a lot over the next couple of weeks, once the written responses are finalized, please share a final response to send with Dean Higuchi and Kelly Zito who will be my out-of-office backups while I am out of the office and Dean or Kelly can send to Irvin De La O.

I am copying into this message a response I received from Tom Huettelman that not everyone was copied on that he sent me with regard to Irvin De La O's questions.

Tom's message:

Regarding a joint lead, my response would be that "under the RCRA program in Region 9, a joint enforcement action at one facility in Hawaii led to a co-lead arrangement. This is the only example." Regarding emergency response, he seemed to miss the part about not having a viable responsible party. Anyway, Dan can cover that part.

Subject: Re: Irvin De La O' Questions on Our Response on Exide in Vernon, CA

Brent we can do this but probably not until later this week. We would also need ORC review for anything regarding Exide that we are putting in writing.

Thanks for the message and information provided. Would it be possible for someone on your staff to put state the exact responses to both of Irvin's questions that they would like for me to send, so that I am sending him back exactly what we would like to say in response to each of his two questions. I am tied up on some other issues today and will not have a lot of time to work on responding to this today.

Please let me know if that would be possible. Thanks in advance.

Brent the second question is not simple to answer but the easiest way to explain it is that there should be 'an imminent and substantial endangerment to human health or the environment AND no state, local or Tribal authority that is addressing the threat'. That is the classic case where an emergency response is warranted. Exide is not that.

But this is really a more nuanced conversation.

Some of the Superfund old timers might recall sites with co leads. Maybe Stringfellow or Casmalia? I am not sure.

Hi Brent,

Thank you for providing us with this response. I only have two follow up questions.

- 1) In the first paragraph, it's stated that "rarely are the state and EPA co-leads." Can you provide us with some examples of when/where this has occurred, and why?
- 2) In the fourth paragraph, you explain the different manners in which EPA's Superfund program provides funding, and one of them is when the "site meets the criteria for an emergency response." What is the criteria for an emergency response?

Thank you,

Irvin De La O | Field Deputy

Office of Congressman Xavier Becerra

Johanna/Irvin -

I am sending along this message and the information to address the issues raised in an e-mail sent to me by Johanna on December 1st which is attached below. My colleagues who were on our most recent call with you have put this information together which I wanted to share with both of you. If after reviewing this information, you have any questions or need any additional information, or would like for me to set up an additional follow up call, please let me know.

Regards,

Brent Maier

Cleanups at hazardous waste sites are generally performed using either the RCRA or Superfund legal authorities. Either the state or EPA take the lead, and rarely are the state and EPA co-leads. In the case of RCRA facilities, states almost always take the lead when they have been delegated the RCRA program, such as in California. At complex sites where the state has the lead, EPA will sometimes contribute limited technical support.

Cleanup levels are derived using EPA's risk assessment protocols, and EPA has established risk-based screening levels as default levels that can be used at many sites. For lead in soil, the current risk-based screening level for residential soils is 400 mg/kg. This number is widely used by EPA for RCRA and Superfund cleanups of lead. California is one of a small number of states that derive their own risk-based screening levels. The science behind EPA's lead cleanup number is currently being reviewed based, in part, on 2012 recommendations from the Centers for Disease Control lowering its screening level from 10 micrograms per deciliter (ug/dL) for lead in children's blood to 5 ug/dL.

In the case of Exide, DTSC has taken the lead for the cleanup using their RCRA authorities and EPA is providing some technical support to DTSC. This

technical support generally involves EPA staff providing advice to DTSC and reviewing some of the technical documents. Several offices at EPA Region 9 are currently contributing support to DTSC, and EPA is a regular participant at the Exide Community Advisory Group (CAG). There is not much additional support available beyond these activities.

EPA's RCRA program does not have separate funding for sites like this and EPA's Superfund program only provides funding when there is not a viable responsible party and when the site is either listed on the Superfund National Priorities List (NPL) or when the site meets the criteria for an emergency response. EPA recognizes that there are lead levels of concern at the residential properties near Exide that need to be addressed. As a result of the different cleanup level used by the state, their cleanup will be more extensive than if EPA were in charge of the cleanup.

At the Pennsylvania site, EPA took the lead under RCRA because the state of Pennsylvania is one of a few states that is not authorized for the RCRA corrective action program. Only EPA can conduct RCRA cleanups in Pennsylvania. At that site, EPA is using a residential soil cleanup lead level of 650 mg/kg based on some of the site specific risk factors.

Subject: Exide in Vernon, CA

Hi Brent,

Thank you for setting up the call between your colleagues and Mr. Becerra's office to listen to our concerns regarding the closure and clean-up of the Exide plant and residential homes in Boyle Heights/ Vernon, California. Per our conversation, Congressman Becerra already spoke to the EPA Administrator Gina McCarthy on this issue, and I believe he asked if it was possible for EPA to provide a risk assessment report and provide recommendations as to what the best steps to move forward with

during this clean-up process.

Based on our conversations, this does not sound like a possibility and we appreciate that you have been working with DTSC to redirect them to other similar instances like the case in Omaha, Nebraska.

I believe it was mentioned during the call that EPA will not be able to become involved either through corrective action or superfund because the contamination of the area does not meet the 400 ppm. I was wondering how does EPA get to that number and what are the statutes regulating this? Does EPA have a breakdown of the homes contaminated and the lead levels or that information that DTSC has? You also mentioned that the contamination level at Vernon, CA was only 85 ppm, do you happen to know how this number was calculated?

Additionally, I just want to flag for you some reports stating that there is some contamination of 5,000 ppm in some homes. In cases like these, where there are homes that exceed the 400 ppm threshold, can EPA become involved and would they be able to provide any resources to DTSC?

Finally, I know we talked about the case in Reading, PA where the EPA regional office worked alongside the state agency to make sure the clean-up process was completed. <http://www3.epa.gov/reg3wcmd/ca/exide.html>. Is the main difference just that the contamination levels were at 650 ppm?

I know I have a lot of questions, but I want to make sure I have all these answers for my boss. I really appreciate all your efforts in setting up the call and answering all of our questions.

Best,

Johanna
